

A soft or a stiff annulus both contain a global edit (bar × bar_bend)

Contained at both stiffness extremes ($\rho=0.25$ and $\rho \geq 16$), global through $\rho \in \{0.5, 1, 4\}$ — a U, not a threshold (41 contained / 49 global).
 Mechanism (interpretation, not measurement): soft annulus $\Rightarrow$ hinge decoupling; stiff annulus $\Rightarrow$ internal blocking;
 the measured fact is the regime flip. Pure-ARAP, synthetic bar; pending DeformSplat cluster corroboration.
